

Personal Protection Of Public Information

Identity theft is the fastest growing crime in the U.S according to the Federal Trade Commission. Hiding or redacting personally identifiable information on accessible public records reduces the risk of misuse, meets legislative mandates and most of all: puts your constituents at ease. *ID Shield*™ has consistently demonstrated the ability to redact images with an accuracy rate exceeding 95%.

ID Shield™ is a “rules-set” based search engine that uses a combination of words, phrases, patterns of text, proximity and location to identify potentially sensitive information on images that have been OCR converted to digital images. After locating the sensitive information on an image, *ID Shield*™ can be configured to:

- automatically redact the data and post the newly protected image or
- send information to an end user (verifier) to manually confirm the redaction.

ID Shield™ is a flexible solution – it can be closely integrated with your document management system or it can run independently. There is no need to abandon your current indexing system in order to simply perform redaction. With *ID Shield*™ YOU control your workflow – we simply add flexible, reliable automated redaction to your current system.

“Burned-in” redaction zones become part of the image and cannot be stripped, even by the trained identity thief. *ID Shield*™ has been used to redact hundreds of millions of images for state and local governments throughout the United States. Whether or not state or federal mandates require the redaction of sensitive information on your images, proactive redaction is sound public policy. We encourage you to contact us to learn how *ID Shield's*™ technology can be used to protect the sensitive data on your images.

I.D. Shield™ Protects
Confidential Information
Security Without Compromise
